

Exercise 1

Create a PHP file that lists the numbers from 0 to 9. Your program should have a single boolean variable that determines how the numbers should be listed. If the variable is true, it should list the numbers in a table with a thin blue border. If the variable is false, it should list the numbers in an unordered bulleted list. You should use a for loop to create the table and the unordered list, and the formatting of the table should be done using styles. Finally, if you view the HTML source generated by your PHP program, it should contain tabs and newlines that make the text clean and easy to read.
